Education Regulation Impact Analyzer

Turns long education policy circulars into plain-language summaries, stakeholder impact, and regulatory timelines.

Built using a practice dataset · Live on Hugging Face Spaces · Kasthuri Sathish

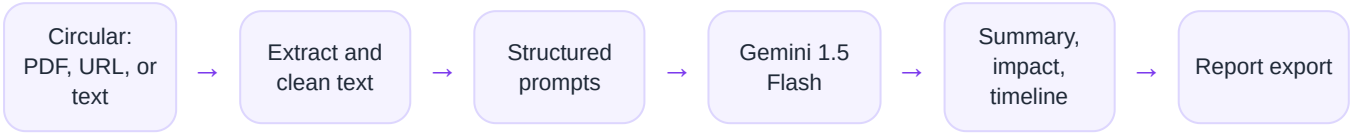
The problem

Education policy circulars are long and full of legal language. Administrators, teachers, and parents struggle to understand what changed, who it affects, and what happens next.

What I built

A Streamlit app where a user adds a circular as a PDF, URL, or pasted text, and gets a plain-language summary, stakeholder impact analysis, a regulatory timeline, and forecasts. Users can also compare regulations and export a report.

How it works



Key product decisions

- Accepted PDF, URL, and pasted text, because circulars reach people in different formats.
- Organized output by stakeholder, so each group sees what affects them.
- Used structured prompts so every analysis follows the same format.
- Chose Gemini 1.5 Flash for its large context window and fast processing of long, multi-page circulars.

Testing and learnings

- Tested with 15 sample education policy notices and circulars, checking extracted timelines and dates against the source PDFs.
- Refined prompt guardrails to reduce speculation on ambiguous deadlines and flag unclear effective dates for human review.
- Forecasts are AI-generated estimates, not verified predictions, so they need human review.
- Limitation: built and tested on a practice dataset.

Tech stack

Python · Gemini 1.5 Flash · Prompt Engineering · LLMs · Streamlit · Hugging Face Spaces
